

License Receipt Import Failure

HYMN Music → DireNote Media | Technical handoff | 15 September 2026

Conclusion: HYMN supplies DireNote with a publicly reachable, unauthenticated PDF URL. The PDF is valid and is served with the expected HTTP headers. DireNote's `CONTENT_INGESTION` endpoint nevertheless returns an HTTP 200 response containing the text *“Failed to upload license receipt”*, instead of its documented JSON result. The remaining failure is in DireNote's receipt-import/storage path or an undocumented provider-side URL policy.

1. Affected submission

Field	Value
HYMN release	Internal release #27 — Jaana Door
Primary artist	DRACK
Content type	Non-Exclusive Licensed
Proof asset	Stored asset #72; non-exclusive beat licence agreement
DireNote outcome	HTTP 200 response body: Validation Error ... Failed to upload license receipt

2. DireNote contract and observed behavior

DireNote API v2.2 documents `license_receipt_url` as conditionally required for `Non-Exclusive Licensed` content and describes it as a **public PDF URL**. It does not document a Google Drive-only requirement, a special host requirement, or an authenticated upload flow.

The documented successful ingestion response is JSON with `success: true`, UPC, track information and warnings. The observed response is neither JSON nor a documented error response despite using HTTP 200.

Official documentation: https://distribution.direnotemedia.com/dnm_api

3. Evidence collected

Check	Observed result	Interpretation
Public Hostinger PDF download	HTTP 200; <code>Content-Type: application/pdf</code> ; <code>Content-Length: 101348</code>	The source file is publicly retrievable and has the correct MIME type.
PDF integrity	101,348 bytes; first bytes are <code>%PDF-</code>	The served object is a PDF, not an HTML error page or redirect.
Public tokenized proof endpoint	HTTP 200; <code>application/pdf</code> ; attachment disposition; public cache headers; no HYMN login/session needed	Current production delivery URL is durable across Hostinger Node deployments.

Older static public_html URL	Intermittently became HTTP 404 after a Node deployment	Removed from the active delivery strategy; it is not used for the latest attempt.
Latest DireNote attempt	Sent the tokenized public endpoint; DireNote still returned "Failed to upload license receipt."	The failure persists after removal of the static-file 404 condition.

4. HYMN implementation safeguards

- Proof links are public to DireNote but unguessable: the URL contains a server-generated provider token and requires no HYMN account session.
- Asset reads are backed by persistent Hostinger storage, not a deployment directory or Vercel storage.
- Responses send `Content-Type: application/pdf`, a PDF filename, byte length, range support, and `Cache-Control: public`.
- HYMN preserves failed attempts and prevents duplicate ingestion during an active submission.
- HYMN now classifies this provider response as `DIRENOTE_LICENSE_RECEIPT_IMPORT_FAILED`, rather than incorrectly treating it as a generic malformed response.

5. Required DireNote investigation

1. Locate the ingestion request for the account and release details above in DireNote logs.
2. From the same DireNote worker that imports receipts, fetch the supplied `license_receipt_url` and record: DNS result, TLS result, HTTP status, final URL after redirects, MIME type, byte count, and body hash.
3. Inspect the subsequent receipt-save/upload operation. The text specifically says *“Failed to upload license receipt”*, which suggests a failure after URL retrieval (for example provider storage, quota, service-account permissions, or an unhandled upload exception).
4. Check any outbound-host allowlist, WAF, IPv4/IPv6 egress, TLS-certificate validation, maximum file-size, and PDF parser constraints that could reject a valid 101 KB HTTPS PDF.
5. Return a machine-readable JSON error with a non-2xx HTTP status when the receipt import fails. Include a stable error code and safe diagnostic reason.

6. Recommended permanent API improvements

Improvement	Why it matters
Idempotency key or client reference on ingestion	Prevents duplicate releases when a provider accepts a request but loses its response.
Status lookup by external reference	Current documented release lookup is by UPC; an auto-generated UPC is unavailable if ingestion acknowledgement is lost.
Structured error schema	Allows labels such as HYMN to distinguish URL-download failures, receipt parsing failures, and provider-storage failures.
Explicit URL acceptance policy	If Google Drive or a particular URL pattern is required, document it. The current v2.2 documentation says only “Public PDF URL.”

7. Requested response from DireNote

Please confirm whether DireNote can fetch the exact supplied public PDF URL from its ingestion worker. If yes, provide the internal error from the subsequent license-receipt upload. If no, provide the exact URL/network/TLS/allowlist requirement. Please also confirm whether any release was created for this request before HYMN retries again.

Appendix: Relevant HYMN changes

Commit	Change
d4698f6	Serves proofs via a durable public tokenized endpoint backed by persistent Hostinger storage.
10a191b	Allows legitimate retries from queued state while preserving duplicate safeguards.
4c69ba0	Classifies the known DireNote receipt-import failure precisely and adds regression coverage.

Security note: This document intentionally omits credentials, authorization tokens, and the full secretized proof URL.
